Megathon 2026 — UI Progress & Future Implementation

Current contribution: **UI / Frontend implementation**. The remaining sections describe work that is yet to be integrated or implemented.

1. Current Status — UI Part Implemented

The current development milestone is focused on building the reusable frontend foundation for a story-driven financial-literacy adventure game for Class 11–12 students, particularly students from underserved communities. The UI is designed to support a game-like experience rather than a conventional lesson interface.

UI Component	Status
Game-style landing page	Implemented
Authentication UI	Implemented
Onboarding / prologue UI	Implemented
Reusable navigation / navbar	Implemented
Region & quest interface	Implemented
Achievements / progress UI	Implemented
Pause & settings screens	Implemented
Audio controls / integration points	Implemented
Feedback, loading & error states	Implemented
Reusable design system / visual tokens	Implemented
Localization-ready UI	Implemented

What has been achieved

- A consistent game-oriented visual language and reusable UI foundation.
- Screens and components are structured so that future gameplay systems can connect to them.
- UI entry points exist for authentication, onboarding, quests, achievements, settings and feedback.
- The frontend is prepared for integration with the story/world, financial-puzzle, AI-feedback and persistence layers.

Important scope clarification: The interactive world map/exploration, actual gameplay, financial puzzles, story engine, AI feedback, persistence and analytics are **not yet implemented**. They are future stages of the project.

2. Future Stages — Work Remaining

1. Interactive World Map & Exploration

Implement the actual navigable island/world, locations, regions and movement/interactions.

2. Story & Quest Engine

Connect the UI to characters, dialogue, quests, branching choices and consequences.

3. Financial Puzzles

Build interactive challenges covering budgeting, saving, investing and financial safety.

4. Student Decision & Game State

Track player choices and use deterministic rules to update progress, rewards and consequences.

5. Gemini Learning Support

Add personalised explanations, hints and educational feedback after deterministic evaluation.

6. Persistence & Analytics

Store student progress, completed quests, decisions and relevant learning/gameplay analytics.

7. Audio, Accessibility & Final UI Polish

Complete audio integration, accessibility checks and UI refinements after gameplay integration.

8. End-to-End Integration & Testing

Connect all modules and test the complete player journey across different scenarios.

9. Demo & Deployment Readiness

Prepare the complete playable experience, deployment build and final demonstration.

Target End-to-End Flow

Landing Page → **Authentication** → **Onboarding** → **World Exploration** → **Story/Character Interaction** → **Financial Quest** → **Student Decision** → **Deterministic Evaluation** → **Gemini Explanation/Hint** → **Consequence** → **Reward/Progress** → **Next Quest**

Immediate Next Priorities

1. Define and freeze shared interfaces between UI, world/story, puzzles, AI and persistence.
2. Implement the interactive world map and connect it to the existing UI.
3. Build one complete financial quest as the first end-to-end vertical slice.
4. Add deterministic decision evaluation and consequence handling.
5. Integrate Gemini for explanations and hints after the financial state is established.
6. Add persistence and extend the completed vertical slice to the remaining learning areas.

Project milestone: The UI/frontend foundation is substantially implemented. The next milestone is to turn this foundation into a playable, story-driven financial-literacy experience by integrating the world, gameplay, puzzles, AI learning support and persistence layers.
